

Medstick – product description

Medstick is a portable, electronic, medical filing system. This means that a comprehensive medical record of a single patient can be stored in a handy device, allowing all data to be easily viewed at the push of a button.

The product consists of hardware (the data storage device), a software program, and a software database.

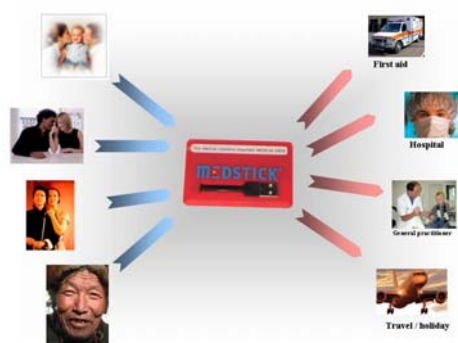

Schematic representation of Medstick

An USB interface is used as the connection between Medstick and a computer.

The database can be directly accessed by the software stored on the data storage device, and also by a database engine. This means that only a computer is required to access the information; no additional software is necessary.

A number of security measures are used to protect the database and accompanying software. This ensures that personal information remains personal, especially if Medstick has been lost or forgotten. Only the patient, or other individuals specifically authorized by the patient, can access information in the database. The general practitioner can, for example, be informed of the password so that the database can be accessed in case of an emergency. Another more extensive version of Medstick is a USB memory stick that uses fingerprint security.

Medstick provides a very comprehensive source of patient information for all medical professionals: The patient doesn't have to decide which information is important; instead medical staff can determine which information is required to make an accurate diagnosis.

Permission from the patient, however, is required for unlimited access to the database.

Medstick Software

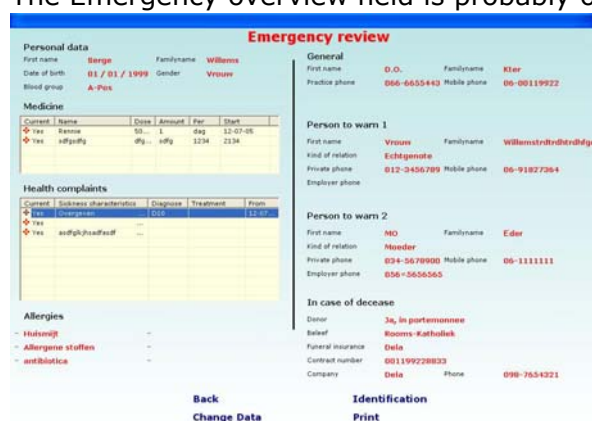

The software interface provides a clear overview of the general health of the patient. By selecting a button on the main menu, the user can easily access one of the sub-categories.

Amongst others, records are provided for: personal details; details of an illness; required emergency treatment; hospital admissions; medication(s); therapies; dental records; birth details; height / weight growth curves; vaccinations; 'stopping smoking' overviews; weight details; and a medical encyclopedia.

Overview of main menu

The Emergency overview field is probably one of the most important fields. Casualty staff can use this field to display the most important medical details needed to stabilize the patient.

Overview of the EMERGENCY-details

Casualty wards of hospitals, general practitioners and ambulance staff – both at home and abroad – can use this feature to save the lives of patients who are either unconscious or too much in shock to provide adequate medical information about themselves. And with one push of a button the entire software can be displayed in English, French, German or Dutch.

Full use can be made of the many available options; the product can also be further developed to suit market demands. As long as the data storage device has enough available memory space, additional data fields, photos, diagrams, graphs/charts, and other information can be added. This can be customized for any particular organization, providing off course that the demand meets minimum requirements.
